in it gpt + fss + mbr is a nightmare to get right brb I want to upgrade to a new version of Ubuntu and install my own customizations like I've done in the past. Will I be able to just update to the new version and keep all of the customizations I've added to my computer? if there is only one thing you need on your disk, use a GPT and use a gptbootimage @Guite51 yes you will be able to upgrade btw. if you have a working linux system, you dont need clonezilla it's an overly complicated piece of crap that was never meant for your usage case you just want a 20gb partition for the bootloader, a partition for the rootfs, the rest of the space should be free if you dont, you might aswell use a cd or just have your ubuntu system on a fat32 partition, since it's windows only !ops l robbly is trolling robbly is trolling: Help!
