On the server I have an asmx web service. The web site URL and the web service URL are different. In the case of a web service which is running on IIS, the ASP.NET web site is running on the default web server. What is the URL for the web site? What is the URL for the web service? A: I don't know about the url's, but they are different. Web service URLs are in a different directory. Now, you might be asking yourself how they are different, and why one would be in a different directory than the other. The answer is that the ASP.NET runtime has a concept of AppDomains. When you deploy an ASP.NET application (even if it's just a web site), it runs in a specific AppDomain. The AppDomain holds all the resources and other information used by the application, including the type of IIS that is running it. In other words, when you deploy the web site, it will run in its own AppDomain. Each AppDomain can have its own web services, and in the web
