filmsOmnifly, not Omnivision, will be  
supplying the FST605 module. It has a  
panel mount module and you will have  
to cut down the ribbon cable to get to the  
USB connectors. The FST605 driver  
should work fine in both x86 and x64  
systems, though I have not tried the  
driver myself. It is available on the  
Omnivision web site. Good luck, let me  
know if you have any trouble with the  
Omnifly module. A bit of caution here,  
if you choose to use a VGA-EEPROM  
solution, you might find yourself  
needing to replace the module every few  
years. The EPROMs are relatively  
inexpensive and easy to replace, but in  
most cases, the display does not support  
the EDID of the older VGA monitor. I

---

use a modular driver solution with a VGA/DVI/HDMI monitor, along with a VGA/DVI-HDMI/DVI monitor. The VGA/DVI-HDMI/DVI monitor is plugged into a VGA and DVI port on the computer. It has 2 connectors, one for the video signal and one for the DVI signal, so it can be configured as either or both. The VGA/DVI monitor is connected to a VGA and DVI port on the front of the modular driver. I have a VGA, DVI, and HDMI port on the back of the modular driver. All my video signals are configured through the modular driver, so I have a single set of cables and adapters, regardless of the monitor. It has been working great for years now. I have actually switched out my monitor twice now, but in all cases, the modular driver is the same. The only time I did notice a problem with the modular driver was when the DVI-HDMI and DVI ports on the modular

---

driver were connected to the monitor (which I thought should never happen) and I had to manually update the EDID. This is really more of a problem if you are using a single DVI-HDMI monitor for both laptop and desktop. I still use the modular driver in this case, but have to change the DVI settings on the modular driver when I switch to the laptop. I have been looking for a driver
