Category:Lists of fictional charactersQ: Ruby on Rails - How to use methods from a gem in models? I have found many sources online and in the gem itself on how to do this. However, my understanding of Ruby and RoR is not enough to understand the process. I'm hoping someone can explain it or direct me to a tutorial I can understand.

How do I call a method from a gem in a model? For example, using the warden gem I have a method called `authenticate_user` that I would like to use. I've found that

I can call it in my model using

`Warden::authenticate_user`. How do I do this? A: In the user gem, you have a file called

`Warden::authenticate_user` which does just what you're looking for. Looking at the class methods, you can see that they are inherited from the base class,

`Warden::Protected` which also has class methods in its module (in the same way that you can call `attr_accessible :name` in your model to get access to the columns defined on your database schema). You can then override the

methods that you wish, so for example in your class (that inherits from `Warden::Protected`) you can define: `class YourModel < Warden::Protected`
`def authenticate_user`
`end`
