Backup Security Checker Keymacro™ is a two-in-one tool that can be used as a unique password manager. With this app, you'll be able to store your accounts, passwords and other data in an encrypted file. Once you install it, a password generator will be added to your OS, which makes sure each saved key is unique. In the other side of the coin, a security checker will be set up as well. It helps to verify if your data are encrypted or not by utilizing strong encryption algorithms, such as AES-256. How does it work? Use Keymacro Password Manager, to have a better experience with your information. When logging in, your information will be presented on a list, allowing you to quickly find what you're looking for. The password generator will generate strong, random passwords, which will help keep your data safe and sound. The encryption, on the other hand, will allow you to encrypt your data if you ever felt that some information are too sensitive. Whether you're a single user or a company, this app will do its best to keep your information confidential. After that, the final step is to generate the security checker. This is where it becomes a lot easier to access all your files, accounts and passwords that were protected by the application. If there is something you wish to verify, the security checker can be used in a way that a cryptographic algorithm is performed against your data. Q: Difference between OpenGL and OpenGL ES2 I understand the differences between OpenGL and OpenGL ES, but what's the difference between OpenGL and OpenGL ES2? A: OpenGL ES is a subset of OpenGL. It implements only the functionality common to all platforms (eg. Direct3D). And of course, it's implemented in JavaScript. On the other hand, Open Graphics Library is just one of the four options of OpenGL (vertex, fragment, geometry, and tessellation shaders), which you can choose at run-time. A: OpenGL ES is part of the OpenGL API. It defines a subset of the functionality of the API, mostly those things common to all platforms, but not all functionality of the API. It is made available to developers through JavaScript on client side, and as such, is no longer part of the API of the desktop, but the API of the web. OpenGL is the full API and does what you expect it to. It provides all functionality common to all platforms (eg. Direct3D), but can also be used to do things that you might not expect (eg. Tessellation shaders), and can also be targeted to a specific platform through the API (eg. vertex shaders).
